

Intellicore CMP — Feature Audit

A Searce Product · Powered by CSRE · Managed cloud intelligence

Intellicore CMP — Feature Audit

Executive Summary

Metric	Count
Total frontend pages	10 (9 app + 1 login)
Pages using data layer (@/lib/api)	0
Pages with 100% hardcoded data	9
Working backend API endpoints	12
Frontend ↔ Backend connections	2 (Login + TopBar user display)
Interactive features (tabs, filters)	Working
Action buttons (Apply Fix, Auto-fix, etc.)	Visual only

Page-by-Page Breakdown

1. Command Center (/) — 470 lines

Data: 100% hardcoded (9 const arrays inline) - intelligenceScores — 5 pillar scores - attentionItems — 4 priority alerts with Memory context - changeItems — 5 recent changes by pillar - workloadHealth — 5 workload type summaries - memoryPatterns — 4 detected patterns - csreActivity , greenChecks , memoryTimeline , timelineMonths

Working interactions: - Tab switching (Intelligence Briefing / 24h Changes / Memory Patterns) - Dismiss button on attention items (local state toggle)

Visual-only: - Memory Timeline chart (static SVG bars) - "View all" links (no target pages)

2. CloudOps (/cloudops) — 867 lines

Data: 100% hardcoded (3+ large inline objects) - VM instances, Kubernetes clusters, databases, serverless functions, data pipelines - Incident history per workload type - Analysis metrics

Working interactions: - Top tabs (All Workloads / Compute / Kubernetes / Databases / Serverless / Data & AI) - Sub-tabs (Overview / Analysis) - Expand/collapse instance detail panels - Analysis category switching

Visual-only: - "View Incident" links - Metric trend indicators (static percentages)

3. FinOps (/finops) — 708 lines

Data: 100% hardcoded (6 const arrays) - `costByPillar` — 5 cost breakdowns with sparkline data - `anomalies` — 2 cost anomalies with Memory correlation - `optimizations` — 3 optimization entries - `monthlyTrend` — 7 months of cost data - `forecast` — 3 future months

Working interactions: - Tab switching (Cost Intelligence / Optimization Memory / Anomalies / Forecasting)

Visual-only: - "Apply Fix" buttons (no API call) - Sparkline charts (rendered but static data) - Cost trend charts

4. SecOps (/secops) — 636 lines

Data: 100% hardcoded (inline objects in JSX) - Security findings with CIS benchmark mappings - IAM risk identities - Compliance frameworks - Remediation history

Working interactions: - Tab switching (Findings Intelligence / IAM Risk / Compliance / Remediation Memory) - Severity filter (Critical / High / Medium / Low) - Expand finding detail panels

Visual-only: - "Auto-fix available" badges (no action) - Posture score donut (static SVG) - "Run Remediation" actions

5. DevOps (/devops) — 799 lines

Data: 100% hardcoded (inline objects) - Risk-scored changes with Memory context - Orchestration requests - Patch compliance data - Deployment history

Working interactions: - Tab switching (Change Intelligence / Orchestration / Patch Compliance / Deployment Memory)

Visual-only: - Risk score badges - Orchestration approval buttons - Deployment rollback options

6. AIOps (/aiops) — 737 lines

Data: 100% hardcoded (9 const arrays) - 3 AI agents with status - Agent activity log - Audit trail - Analysis tools grid - Usage governance data

Working interactions: - Tab switching (AI Agents / Query Infrastructure / AI Analysis Tools / Usage & Governance) - Query input field (accepts text but doesn't call API) - Quick query suggestions (populate input field)

Visual-only: - AI Agent status indicators - "Run Analysis" tool cards - Query send button (no backend call) - Confidence threshold sliders

7. Memory (/memory) — 756 lines

Data: 100% hardcoded (5 const arrays) - 8 memory entries - 4 incident patterns - 4 remediation library entries - 4 cross-pillar learnings

Working interactions: - Tab switching (All Memory / Incident Patterns / Remediation Library / Learnings) - Pillar filter (All / CloudOps / FinOps / SecOps / DevOps) - Search input (filters locally — functional)

Visual-only: - Pattern occurrence bar charts - "View Details" links - Auto-fix Library section

8. Alerts (/alerts) — 300 lines

Data: 100% hardcoded (2 const arrays) - 4 alert objects with severity, status, description

Working interactions: - Status filter tabs (All / Active / Acknowledged / Resolved) - Expand/collapse alert detail cards

Visual-only: - "Acknowledge" buttons (no API call) - Alert severity badges - Baseline/current/increase metrics

9. Assets/CMDB (/assets) — 427 lines

Data: 100% hardcoded (1 large asset array) - Cloud asset inventory with type, provider, region, cost

Working interactions: - Search input (filters locally — functional) - Provider filter tabs - Sort controls - Grid/table view toggle

Visual-only: - Asset detail links (href="#") - Cost values

10. Login (/login) — 10 lines + LoginForm (222 lines)

Data: DYNAMIC — calls real backend API - `POST /api/auth/login` — email/password authentication - `POST /api/auth/totp/verify` — TOTP 2FA verification

Working interactions: - Email/password form submission → backend API - TOTP setup with QR code display - TOTP code verification - "Remember device" toggle - Redirect after successful login

Status: Fully functional (requires running backend)

Backend API Status

Working Endpoints (12 total)

Endpoint	Method	Status	Frontend Consumer
/health	GET	Working	Docker healthcheck
/ready	GET	Working	Docker healthcheck
/auth/login	POST	Working	LoginForm
/auth/totp/verify	POST	Working	LoginForm
/auth/session/check	GET	Working	Middleware (Caddy)
/auth/logout	POST	Working	LogoutButton
/auth/me	GET	Working	TopBar
/memory/timeline	GET	Working	Not connected to frontend
/memory/patterns	GET	Working	Not connected to frontend
/memory/event/{id}	GET	Working	Not connected to frontend
/memory/chat	POST	Working	Not connected to frontend
/events/ingest	POST	Working	Not connected to frontend
/cost/summary	GET	Stub	Not connected to frontend
/security/summary	GET	Stub	Not connected to frontend

Backend Services

- **Auth:** Full email/password + TOTP (Google Authenticator compatible) — JWT + Redis sessions
- **Memory:** Neo4j-backed knowledge graph with timeline, patterns, causal chains, chat
- **Events:** Ingest pipeline for cloud events → Neo4j graph
- **Cost/Security:** Stub endpoints returning placeholder data

Data Layer Status

Created but NOT wired

File	Purpose	Status
lib/api/types.ts	25 TypeScript interfaces	Created, unused
lib/api/mock.ts	26 mock endpoints	Created, unused
lib/api/client.ts	apiFetch() with mock/real swap	Created, unused
lib/api/hooks.ts	useApiData() React hook	Created, unused
lib/api/index.ts	Barrel export	Created, unused

Separate legacy client

File	Purpose	Status
lib/api.ts	Auth + Memory backend calls	Used by TopBar, LoginForm

What Works End-to-End

- 1. **Login flow** — Email → Password → TOTP setup/verify → JWT session → redirect to app
- 2. **Session display** — TopBar fetches /auth/me and shows user email + initials
- 3. **Logout** — Clears session cookie via /auth/logout
- 4. **Navigation** — Sidebar routing between all 9 app pages
- 5. **Tab/filter interactions** — All tab switches, severity filters, search inputs work (local state)
- 6. **Build/Deploy pipeline** — npm run build succeeds, Docker Compose stack deploys
- 7. **Health checks** — /health and /ready endpoints

What Does NOT Work

- 1. **All dashboard data is static** — scores, alerts, costs, findings, memory entries are const arrays
- 2. **Action buttons are decorative** — "Apply Fix", "Auto-fix", "Acknowledge", "Remediate" do nothing
- 3. **AIOps query interface** — accepts input but doesn't call any API
- 4. **Memory search** — TopBar search bar ("Ask Memory anything") has no handler
- 5. **Dark mode toggle** — sidebar button exists, no implementation
- 6. **Notifications bell** — visual only
- 7. **Charts/sparklines** — render but show static hardcoded data
- 8. **Cost/Security backend** — stub endpoints return empty data
